

AGRONET

ABSTRACT

Agronet is a site which basically provides services to farmers and landowners who have no idea how to make use of their lands. When a landowner possesses a land which is currently of no use in any aspect (i.e) it is only bought for investment, until the landowner figures out what to do with it, if criteria favors, he/she can lend their land to perform agricultural activities in it and obtain a considerable amount of share from the yield. The farmers can benefit through this site by working on the fields of these prospective landowners who wish to invest their land on agriculture. These farmers can acquire the major income from the yield as only the land is owned by the owners and the resources for agricultural practices should be bought by the farmers itself. When a landowner applies in this site to invest their land for agriculture, soil test technicians are appointed to test the soil of their lands so as to check if their land is optimal for agriculture. This comes under sustainable development because no will can go to waste and agriculture only improves the fertility of the land which is also a huge gain for agriculture.
